## Derivation of the equations for the X-ray transform

The $\gamma$-radiation is attenuated exponentially along its passage through the material, because of scattering and absorption interactions with the atoms in the material:

$$
\begin{equation*}
I=I_{0} e^{-\int_{0}^{t} f(t) d t} \tag{1}
\end{equation*}
$$

Here $t$ indicates the thickness of the attenuating material that has been penetrated and $\mathrm{I}_{0}$ is the incident radiation intensity. The attenuation properties of the material are described by the product $f(t)=\mu(t) \rho(t)$, where $\mu(t)$ is the mass-attenuation coefficient $\left(m^{2} / \mathrm{kg}\right)$ and $\rho(\mathrm{t})$ is the density $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$.

The fan beam projections $g(\sigma, \beta)$ of an object $f(x, y)$ are line integrals obtained by the X-ray transform:

$$
\begin{align*}
& \mathrm{g}(\sigma, \beta)=\iint \mathrm{f}(\mathrm{x}, \mathrm{y}) \delta[\mathrm{D} \sin \sigma-\mathrm{x} \cos (\sigma+\beta)-\mathrm{y} \sin (\sigma+\beta)] \mathrm{dxdy}  \tag{2}\\
& =\int_{\mathrm{t}_{\min }(\sigma, \beta)}^{\mathrm{t}_{\max }(\sigma, \beta)} \mathrm{f}[-\mathrm{D} \sin \beta+\mathrm{t} \sin (\sigma+\beta), \mathrm{D} \cos \beta-\mathrm{t} \cos (\sigma+\beta)] \mathrm{dt} \tag{3}
\end{align*}
$$

where the notation is illustrated in Fig. 1. Each line integral, $g(\sigma, \beta)$, is defined by the view angle of the projection, $\beta \in[0,2 \pi]$, which expresses the location of the x-ray source, and the fan angle, $\sigma \in\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$, which selects a particular ray in the projection. The radius of motion of the x-ray source is D .

FIG. 1
The geometry of the X-ray transform.
In the backprojection-of-filtered-projections reconstruction algorithm, the image $f(x, y)$ is obtained from the integral:

$$
\begin{equation*}
\mathrm{f}(\mathrm{x}, \mathrm{y})=\frac{1}{2} \int_{0}^{2 \pi} \frac{\tilde{g}(\sigma, \beta)_{\sigma=\sigma^{\prime}(\mathrm{x}, \mathrm{y}, \beta)}}{\mathrm{L}^{2}(\mathrm{x}, \mathrm{y}, \beta)} \mathrm{d} \beta \tag{4}
\end{equation*}
$$

The integral over $\beta$ is known as the backprojection and $\tilde{g}(\sigma, \beta)$ are the filtered projections given by:

$$
\begin{aligned}
\tilde{\mathrm{g}}\left(\sigma^{\prime}, \beta\right) & =\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \mathrm{~g}(\sigma, \beta) \mathrm{h}\left(\sin \left(\sigma^{\prime}-\sigma\right)\right) D \cos \sigma \mathrm{~d} \sigma \\
\tilde{\mathrm{~g}}\left(\sigma^{\prime}, \beta\right) & =\int_{-\frac{\pi}{2}}^{\frac{\pi}{2}} \mathrm{~g}(\sigma, \beta) \mathrm{h}\left(\sin \left(\sigma^{\prime}-\sigma\right)\right) D \cos \sigma \mathrm{~d} \sigma
\end{aligned}
$$

where:

$$
\begin{aligned}
h\left(\sin \left(\sigma^{\prime}-\sigma\right)\right) & =\int_{-\infty}^{\infty}\left|\omega_{\ell}\right| \mathrm{e}^{-\mathrm{i} \omega_{\ell} \sin \left(\sigma^{\prime}-\sigma\right)} \mathrm{d} \omega_{\ell} \\
& =\left(\frac{\sigma^{\prime}-\sigma}{\sin \left(\sigma^{\prime}-\sigma\right)}\right)^{2} \int_{-\infty}^{\infty}\left|\omega_{\sigma}\right| \mathrm{e}^{-\omega_{\sigma}\left(\sigma^{\prime}-\sigma\right)} \mathrm{d} \omega_{\sigma}=\left(\frac{\sigma^{\prime}-\sigma}{\sin \left(\sigma^{\prime}-\sigma\right)}\right)^{2} \mathrm{~h}\left(\sigma^{\prime}-\sigma\right)
\end{aligned}
$$

and $\sigma^{\prime}(\mathrm{x}, \mathrm{y}, \beta)$ and $\mathrm{L}(\mathrm{x}, \mathrm{y}, \beta)$ describe the fan angle of the ray traversing through the point $(\mathrm{x}, \mathrm{y})$, and the distance from the x -ray source to the point $(\mathrm{x}, \mathrm{y})$ in the image is:

$$
\begin{align*}
& \sigma^{\prime}(x, y, \beta)=\arctan \left[\frac{x \cos \beta+y \sin \beta}{D+x \sin \beta-y \cos \beta}\right]  \tag{5}\\
& L(x, y, \beta)=\sqrt{(x \cos \beta+y \sin \beta)^{2}+(D+x \sin \beta-y \cos \beta)^{2}} \tag{6}
\end{align*}
$$
